Call for proposals for Unitree Go2 Edu Robot-based Projects

The Unitree Go2 Edu is an advanced quadruped robot designed for research and education, featuring an open-source SDK and flexible hardware integration for developing custom AI and control algorithms. It has the following configurations:

MODEL	Unitree Go2 Edu
ON-BOARD COMPUTER	Nvidia Jetson Orin NX 16GB
SENSOR COMPONENTS (BUILT-IN)	Unitree L1 Lidar, IMU, Microphone, RGB Camera
EXTRA COMPONENTS (BOUGHT-TOGETHER)	Intel Realsense D435i Depth Camera, Hesai XT16 3D Lidar, Unitree D1 Robot Arm

WSO2 is calling for proposals for projects that use the Unitree Go2 Edu Robot in creative ways. Selected proposals will receive access to a *Unitree Go2 Edu Robot* (located at the WSO2 Colombo office) for the project and also receive a limited grant to cover expenses related to the project.

Access to the robot will let researchers go beyond simulation environments and ground their solutions. It is one of the most powerful robotics platforms available and can provide an edge in many research-related projects. The following are a few examples:

- **L1 LiDAR:** Giving a 360X90 field of view, this a perfect environment for Multi-Sensor Fusion SLAM (Simultaneous Localization and Mapping).
- **Affordable Mobile Manipulation (QMM):** The integration of the force-controlled D1 arm allows for complex research into how a quadruped can interact with its environment (e.g., opening doors).
- **Visual Language Models:** The 100 TOPS Orin NX allows you to run heavy vision-language models or perform real-time neural network optimizations directly on the robot, without a remote base station.
- **Navigation:** Combining the Hesai XT16 (structural data) and Realsense D435i (depth/texture) enables high-fidelity research into navigating "visually confusing" environments like glass-walled offices or smoke-filled rooms.
- **Socially-Aware Navigation (HRI):** Its built-in intercom and microphone system make it a unique platform for studying how robots should communicate and move around humans in public spaces.

If interested, please submit a 2-3 page proposal describing the following and send it to **send it to Dr. Srinath Perera, Head of Research, srinath@wso2.com before March 31, 2026.**

Title:
Problem scopes:
How will the solution work?
Expected outcome(s):
Why will Unitree Go2 Edu provide a unique edge to the project?

Selected teams must first work with the simulator before accessing the robot. Selected teams will be expected to sign an agreement with WSO2 to commit to publishing the work and to acknowledge WSO2's contribution towards the work.

Please contact Srinath for more information.
